THE KODAK SAFETY FILM

For the purpose of this test, a Kodak Safety Film was used. The film was exposed to a light source of known intensity and duration. The resulting image was then developed and fixed. The film was then measured for its optical density. The results of the test are shown in the table below.

Exposure Time (sec)	Optical Density
1/1000	0.15
1/500	0.25
1/250	0.35
1/125	0.45
1/60	0.55
1/30	0.65
1/15	0.75
1/8	0.85
1/4	0.95
1/2	1.05

8	1.45
15	1.55
30	1.65
60	1.75
125	1.85
250	1.95
500	2.05
1000	2.15

The results of the test show that the optical density of the film increases with exposure time. The relationship between exposure time and optical density is approximately linear. This indicates that the film is sensitive to light and that the exposure time can be used to control the optical density of the image.
